SUBJECT: Network-Wide EBITDA Recovery: The Protein Yield Protocol

EXECUTIVE SUMMARY

At the operational scale of Bloomin' Brands, standard F&B inventory systems create a false sense of security. While they efficiently track gross weight and invoice costs, they completely fail to track the biological reality of protein yield across hundreds of units. I refer to this systemic blind spot as "The Ghost Math."

THE SCALE OF THE BLIND SPOT

After 20 years as a high-volume F&B operator, I identified that a massive volume of margin is silently lost in operations like Outback due to structural, unmonitored variables:

- **The Multiplier Effect:** A mere 0.5 oz variance in trimming or portioning at the prep station seems negligible per plate, but across 700+ locations, it translates into millions of dollars in untracked EBITDA leakage annually.
- **Inbound Spec Tolerance:** Paying premium prices for excess fat caps and untrimmed waste at the receiving docks without a real-time, network-wide reconciliation mechanism.
- **Data Latency:** Relying on end-of-month P&L reports to identify yield variance is a post-mortem exercise. By the time the variance is caught, the margin is already gone.

THE PROTOTYPE INITIATIVE

Standard software tells you what your network *bought*. Brasa OS tells you what your network actually *yielded*.

I have mapped a functioning "Digital Twin" prototype designed for high-volume, multi-unit steakhouse operations. The model establishes a real-time, forensic chain of custody for protein from the receiving dock to the guest plate, standardizing yield governance across the entire Florida footprint.

THE 15-MINUTE VALIDATION

Following up on my recent email regarding the Bloomin' turnaround, I know your inbox is a war zone. I am sending this physical audit brief directly to your desk because tightening margins requires moving past theoretical software pitches and dealing purely with the mathematical reality of your yield.

The proposal stands: Give me 15 minutes to plug your actual volume data into this framework. If the "Ghost Math" isn't leaking margin from your operations, I will walk away. If it is, we discuss a pilot.
