SUBJECT: EBITDA Recovery Protocol: Yield Variance at Council Oak & Rez Grill

EXECUTIVE SUMMARY

At the operational scale of Seminole Hard Rock Tampa, traditional F&B inventory software is structurally inadequate for managing high-value protein supply chains. While current systems track gross weight and financial cost, they fail to track the biological reality of protein yield—a systemic blind spot I refer to as "The Ghost Math."

THE OPERATIONAL BLIND SPOT

After 20 years managing high-volume F&B operations, I identified a structural EBITDA leak driven by three unmonitored variables in casino environments:

- **Inbound Spec Tolerance:** Paying USDA Prime prices for excess fat caps and untrimmed waste at the receiving dock.
- **Fabrication Entropy:** Undetected yield loss at the butcher station (a 0.5 oz variance per portion scales into a massive fiscal leak).
- **The VIP Comp Void:** High-tier proteins given as comps that bypass rigorous yield-depletion audits.

THE PROTOTYPE INITIATIVE

Standard software tells you what you *bought*. Brasa OS tells you what you actually *yielded*.

I have taken the initiative to map a functioning "Digital Twin" prototype specifically tailored to the protein supply chain of Council Oak and The Rez Grill. The model tracks variance from the receiving dock to the guest plate, establishing a forensic chain of custody for high-value meat.

THE 15-MINUTE VALIDATION

I am locally based in Tampa. I request a brief, 15-minute operational review with you or your VP of Food & Beverage to demonstrate this prototype on the iPad.

The proposal is simple: Give me 15 minutes to plug your actual volume data into this framework. If the "Ghost Math" isn't leaking margin from your operation, I will walk away. If it is, we launch a pilot.
